frontiers of electronic commerce by Ravi Kalakota and Andrew B. Whinston Pearson single person this age. I spent 5 weeks in the country just about this time of year. There was no snow. We took the dog up in the hills, with the green leaves and flowers and the crispy, dry grass underfoot. We walked out and picked sage for herbal tea. We ran out of food for the dog and bought a pheasant. We went fishing. We drank wine. We drove to low-lying, spring-frosted slopes and looked for mushrooms and wild onions. I picked a rose and gave it to the dog to play with. All in all, it was a pretty good time to be living in Japan. This time of year is also a good time to think about how we spend our time here. We live in a very small community. There's snow outside our front door and a very small grocery store. There's a good brewery. We have some friends, like Tamara and her kids and their dogs. And we have some friends, like Tom and his daughter, who live in a different community. We're a small family; we don't have enough room for more than two people at a time. We are thin-skinned, and there's a lot to tend to here; we need to pay attention to the needs of people who might be living in the same community, having the same problems. I don't think we have enough family here. We barely ever see our aunt and uncle, our cousins and their families. I don't think we've ever had any brothers or sisters. We don't all live in the same village. It feels that my brothers and sisters are hundreds of miles away, across the ocean. This year, in the spring, I am going to New York for a week with my sister and her family. We are going to a reunion, and we will be together in a place where I can't imagine myself and many of my friends having an adequate conversation. When I left the city in 2010, some of my friends were worried about whether I'd be okay. Back then, we knew we would be able to talk each other. Now, it's as if it will be harder. I have long felt that I don't know how

The commercial needs of manufacturers, retailers, and consumers are ... Frontiers of Electronic Commerce, Ravi Kalakota, Andrew B. Whinston. Electronic commerce encyclopedia Frontiers of the Far from being a young technology, electronic commerce today is already a \$ 28 billion market. A look at the background and some future predictions. TRANSLATIONAL RESEARCH (Mentored Research) PROJECT SUMMARY Proteins protein interactions play crucial roles in the regulation of many biological pathways. These interactions are often highly specific, which means that, ideally, they will only be triggered when conditions are optimal for the complex to assemble. These interactions are often reversible, which means that if the conditions are not optimal for assembly, the complex will disassemble. The interaction partners of many proteins are not well characterized, which has limited our ability to probe the nature of these interactions. To make these fundamental discoveries, we need new tools that can be used to detect and trap protein complexes, understanding the role of individual amino acids in complex assembly, and how these interactions are regulated at different cellular locations. Here, we propose to develop new methods that will allow us to use X-ray crystallography to determine the structures of protein complexes and to use mass spectrometry to define the residues required for complex assembly. We believe that this approach will yield major new insights into protein complex assembly. Importantly, because of our ability to detect and trap protein complexes in their native cellular context, this work will impact several fundamental questions in biology, including how proteins are trafficked f678ea9f9e
